Period 2

2 June 2014

In the 1970s we first called the changes of the global atmosphere as Global Cooling because the climate was getting cooling every year. However the term global warming is the opposite of cooling, because the changes like industrialization happened for countries all over the globe. Now everyone is involved in global warming, what exactly is global warming it is the increase in temperature of caused by the CO<sub>2</sub> emissions. China is rank top of releases the most CO<sub>2</sub> then it's the United States, lastly India. The outcome of the intense changes of the climate America introduced Earth Day in 1970s, on this day Americans had to show some sort action to help the environment. But before than there were acts that help americans to get involved with the environment. The Acts like conservation act enacted by Teddy Roosevelt, he wanted to save national parks for future generations. Industrialization was fully developed in the United States first and other countries wanted to be involved factories and car developments as well. Even though the US set a trend it also made future problems, such as Accelerating Sea Level Rise and increased castal flooding, longer and more damaging wildfire seasons, more frequent and intense heat waves, an increase in extreme weather events, etc. All these events will set off the whole awareness to every country in the world. The historical significance is the name change from global cooling to global warming, it only to a couple of decades to know that the globe was getting warmer. Having this knowledge hopefully everyone sees the warnings and try to do something to change for the best.
